Abstracts

According to this study, the global Intraoperative Monitoring (IOM) Solutions market size will reach US$ 6056 million by 2031.

The term intraoperative neuromonitoring (IOM or IONM) refers to the monitoring of neurophysiological functions of the central and peripheral nervous system during surgical procedures. IOM is a real-time assessment of the brain, spinal cord and nerves during any surgery that places these structures at risk. The goal of IOM is to provide the surgeon with up-to-the-second information about your nervous systems. Surgeons rely on the immediate feedback of IOM to make the best decisions for you and your health during the surgery.

Intraoperative monitoring (IOM) is a critical technique for monitoring neurosurgery as it offers an early warning concerning motor and sensory functions during surgery by reducing intervention time and risk. The growing prevalence of various lifestyles associated with chronic diseases such as neurological and cardiovascular conditions and increasing emphasis on patient safety during complicated surgeries are some of the factors expected to drive the overall market growth.
