Intraoral X-ray film is a specialized photosensitive material used for X-ray imaging of the oral cavity. It is placed inside the mouth and, under X-ray exposure, different tissues within the oral cavity, such as teeth and alveolar bone, absorb X-rays to varying degrees, causing corresponding areas of the film to become sensitized. After undergoing chemical processes such as developing and fixing, the film produces an image that reflects the internal structures of the oral cavity. This image aids oral healthcare professionals in observing the morphology and pathological conditions of teeth, periodontal tissues, periapical tissues, and other structures.
