The global Intrathecal Drug Pain Pump market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

An intrathecal drug pain pump, also known as an intrathecal drug delivery system or simply an intrathecal pump, is a medical device used to manage chronic pain by delivering medication directly into the intrathecal space of the spinal cord. This method of pain management is known as intrathecal drug delivery.

The pump is surgically implanted under the skin of the abdomen or flank, and a small catheter is threaded through the spinal canal and positioned within the intrathecal space. This catheter is connected to the pump. It contains a medication reservoir that can be filled with specific pain-relieving medications, such as opioids (e.g., morphine) or muscle relaxants. The medications are typically highly concentrated to minimize the volume of fluid being delivered. The pump is programmable and can be adjusted by a healthcare provider to deliver the medication at a precise rate and dosage tailored to the patient's pain management needs. This personalized control allows for effective pain relief with minimal side effects.

Intrathecal drug pain pumps are primarily used in cases of chronic pain when other pain management methods, such as oral medications, physical therapy, or nerve blocks, have not provided adequate relief or have resulted in unacceptable side effects. Conditions that may benefit from intrathecal drug delivery include severe chronic back pain, cancer-related pain, neuropathic pain, and pain related to conditions like failed back surgery syndrome.
