Indwelling intravascular access devices (catheters) provide a route for: administering fluids, blood products, nutrients and intravenous medications; monitoring haemodynamic function; maintaining emergency vascular access; and obtaining blood specimens. Intravascular devices (IVDs) are catheters that are usually inserted into peripheral veins (e.g. small veins in the arms). Peripheral arterial devices are also used for some patients.

Some central venous catheters are inserted through a peripheral vein site (peripherally inserted central catheters). They can be used for a prolonged period of time (e.g. for long chemotherapy(link is external) regimens, extended antibiotic therapy, or total parenteral nutrition). IVD insertion is the most commonly performed invasive healthcare
