Intumescent strips for fire doors are specialized passive fire protection components designed to enhance the fire resistance of doors by sealing gaps between the door leaf and the frame during a fire. These strips are typically made from intumescent materials, such as graphite-based or sodium silicate-based compounds, which remain dormant under normal conditions but expand significantly when exposed to high temperatures, usually above 180 °C. Upon expansion, they form an insulating char that fills gaps and prevents the passage of smoke, hot gases, and flames, thereby maintaining the fire integrity and insulation of the door assembly. Intumescent strips are commonly integrated into grooves along the edges of fire-rated doors and may be combined with smoke seals, acoustic seals, or cold smoke brushes for multifunctional performance. They are manufactured in various widths, thicknesses, and finishes to suit different door designs and regulatory standards.
