An invasive brain-computer interface (BCI) is a type of neuroengineering device that involves surgical implantation of electrode arrays or sensors directly into the cerebral cortex or deep brain nuclei. It is designed to acquire real-time neuronal electrical activity (such as action potentials, local field potentials) or deliver electrical stimulation to the brain, enabling information exchange between the brain and external devices (e.g., computers, robotic arms). Characterized by direct contact with neural tissue, it provides high-resolution neural signals but carries risks of surgery, immune rejection, and long-term biocompatibility challenges.

United States market for Invasive Brain Computer Interface is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Invasive Brain Computer Interface is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

Europe market for Invasive Brain Computer Interface is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
