An invasive flexible neural electrode is an implantable electrode, usually made of flexible materials (such as conductive polymers or metal-polymer composites), that can be in close contact with neural tissue to record signals and electrically stimulate. It is designed to reduce damage to surrounding biological tissue and improve long-term biocompatibility with neural tissue. This type of electrode is widely used in medical fields such as neuroscience research, brain-computer interfaces, neural repair, and deep brain stimulation. It can provide high-precision neural signal monitoring and regulation to help treat neurological diseases or restore neural function.
