The global Invasive Species Management market size is predicted to grow from US\$ 200 million in 2025 to US\$ 268 million in 2032; it is expected to grow at a CAGR of 4.3% from 2026 to 2032.

Invasive Species Management refers to a comprehensive set of planned practices including early monitoring, risk assessment, containment, eradication and ecological restoration, targeting non-native plants, animals and microorganisms that invade local ecosystems, disrupt biodiversity, damage agricultural production, degrade natural environments and incur economic losses, adopting scientific, targeted methods to curb species spread and mitigate harmful impacts.

Driven by global trade expansion and climate change, the invasive species management industry shows clear trends of digital intelligent monitoring, eco-friendly biological control and standardized biosecurity supervision; core opportunities lie in stricter national environmental policies, rising government ecological investment, and growing demand from agriculture, water conservancy and urban ecological governance, while major challenges include limited sustained funding, fragmented cross-regional coordination, strong adaptability of invasive species, and potential secondary ecological damage caused by improper control measures.
