The global Inverse Synthetic Aperture Radar market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Inverse Synthetic Aperture Radar (ISAR for short) is a radar imaging technology used to obtain high-resolution radar images of targets. Different from traditional synthetic aperture radar (SAR), ISAR achieves target imaging by receiving changes in radar echoes caused by the movement of the target itself. ISAR technology is mainly used in the identification and tracking of aviation targets and ship targets. By obtaining high-resolution radar images of the target, detailed information about the target can be provided, such as the target's outline, structure, and characteristics, which is of great significance for target identification, classification, and tracking. ISAR technology is widely used in military reconnaissance, maritime surveillance, air target identification and other fields.

United States market for Inverse Synthetic Aperture Radar is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
