Gravity inverted arm davit is a rotating type davit. When the boat is lowered, the davit arm rotates around the pin at the lower end of the davit, causing the davit arm to tilt outward and lift the boat outboard. Therefore, it is also called a single-fulcrum davit. This kind of davit has a simple force on the fulcrum and no outward movement when the davit arm is tilted outboard. When the ship is in severe working conditions with an internal heel of 20° and a trim of 10°, the davit arm will not cause jamming.

The global Inverted Arm Gravity Davit market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
