A heat pump uses electricity and refrigerant to move heat from one location to another. To provide heat, it extracts heat from outside air and transfers it to a refrigeration coolant – the coolant is then compressed, which increases the temperature significantly. The now hot coolant is then moved to the pool water side of the heat pump, which then passes pool water over the pipework containing hot coolant, increasing the temperature of your swimming pool water.

Applying inverter technology in outdoor swimming pool heat pumps is relatively new. The technology makes it possible to run the fan and the compressor within the heat pump at variable speeds. Therefore, the inverter heat pump is capable of adjusting output to match the actual demand from the pool very accurately.
