Ion beam etching equipment is a device that uses high-energy ion beams to perform micro-nano processing on solid materials. The principle is to fill inert gases such as argon into the ion source discharge chamber and ionize it to form plasma. The ions are then drawn out and accelerated by the grid in beam form. The ion beam with a certain energy enters the studio, shoots toward the solid surface, collides with the atoms on the solid surface, and causes the material atoms to sputter, thereby achieving the etching purpose.

The global Ion Beam Etching Equipment market size is projected to grow from US\$ 996 million in 2024 to US\$ 1653 million in 2030; it is expected to grow at a CAGR of 8.8% from 2024 to 2030.
