Ion beam polishing service is a technology that uses ions and electrons in high-speed plasma to polish the surface of materials. It is essentially a physical polishing technology, also known as 'ion sputtering polishing'. Its working principle is mainly based on the use of inert gas ions (such as argon ions) with a certain energy to bombard the surface of the workpiece in a vacuum state, and remove the surface material through the physical sputtering effect. This technology achieves material removal at the atomic level, thereby achieving nanometer-level processing accuracy. It is widely used in the processing and manufacturing of precision optical components, especially high-end optical components.

The global Ion Beam Polishing Services market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
