The global Ion Chromatograph market size is predicted to grow from US\$ 3027 million in 2025 to US\$ 4708 million in 2032; it is expected to grow at a CAGR of 6.6% from 2026 to 2032.

Ion chromatograph is a scientific analytical instrument that can quickly and easily analyze a variety of anions and cations. It is widely used in environmental protection, food safety, drinking water safety, quality inspection and other fields.

The development of ion chromatographs mainly includes the following aspects: first, the mobile phase delivery system, whose pressure resistance is limited, so the pressure resistance level is constantly improving; second, the precision and miniaturization of the sampling system, which mainly involves the introduction of Sample accuracy and micro-volume, valve switching technology application; then there is the perfect combination of water electrolysis and membrane technology, mainly eluent generators and suppressors; the stability of the detection system (conductance and pulse ampere), mainly related to reducing noise and Improve stability; and finally, the compatibility of the entire instrument, including the compatibility of the constant temperature system, instruments and software. For the future development of the stationary phase, there are several main aspects: 1. New matrix materials, the goal is to improve its pressure resistance, rigidity, and thermal stability without changing acid and alkali resistance; 2. New modifications Materials, the goal is to improve the dynamic speed of latex agglomeration and grafting, and improve hydrophilicity. New decorative materials include ionic liquids, carbon nanotubes, graphene, hydrothermal carbon spheres, hyperbranched and dendritic macromolecules, metal organic Framework compounds, covalent organic framework materials, etc. New decoration methods include chemical bonds, electrostatic adsorption, intermolecular forces (coating), etc.
