## Abstracts

The global Ion Exchange Chromatography Packing Material market size is predicted to grow from US\$ 685 million in 2025 to US\$ 983 million in 2032; it is expected to grow at a CAGR of 5.8% from 2026 to 2032.

In 2025, global sales of Ion Exchange Chromatography Packing Material reached approximately 350,000 liters, with an average market price of about USD 2,000 per liter, an annual production capacity of roughly 390,000 liters, and an industry-average gross margin of approximately 25%.

Ion Exchange Chromatography Packing Material refers to functional chromatography media or resins used in ion-exchange separation and purification. These materials are typically built on porous polymer, agarose, dextran, or synthetic matrices with positively or negatively charged ligands immobilized on the surface, enabling adsorption, elution, and separation according to the net charge of target molecules. They can be divided into anion-exchange and cation-exchange media, and further into strong and weak ion exchangers. They are widely used for the capture and polishing of proteins, antibodies, nucleic acids, vaccine intermediates, and other charged biomolecules, making them one of the most fundamental media types in downstream bioprocessing.

Upstream of this industry are matrix materials such as agarose, dextran, methacrylate, and styrenic polymers, along with ligands/functional groups, crosslinkers, activation reagents, buffer salts, solvents, and chromatography column hardware. The midstream consists of ion-exchange media manufacturers that carry out matrix synthesis, surface activation, ligand coupling, particle-size control, column compatibility design, and quality validation. Downstream demand mainly comes from biopharmaceutical companies, CDMOs, vaccine manufacturers, blood-product producers, research institutes, and

analytical laboratories, with major use cases in the capture, impurity removal, and polishing of monoclonal antibodies, recombinant proteins, nucleic-acid therapeutics, and vaccines.
