The global Ion-sliced Lithium Niobate Thin Film (LNTF) market size is predicted to grow from US\$ 167 million in 2025 to US\$ 1872 million in 2032; it is expected to grow at a CAGR of 42.1% from 2026 to 2032.

Ion-sliced lithium niobate thin film is a novel optoelectronic material. It is a thin - film material prepared from lithium niobate (LiNbO₃) crystals through a special ion-slicing technique. The process uses ion implantation to weaken the crystal bondage in a lithium niobate wafer.

Ion-sliced Lithium Niobate Thin Film (LNTF) refers to thin-film LiNbO₃ fabricated using ion implantation and exfoliation techniques, a key pathway for achieving high-quality TFLN (Thin-Film Lithium Niobate) wafers used in next-generation photonic devices. This method borrows principles from the Smart Cut[®] process developed in SOI manufacturing but is optimized for lithium niobate's unique properties.

The ion slicing process typically involves hydrogen or helium ion implantation into a bulk LiNbO₃ substrate to create a well-defined layer of microcavities. Afterward, the wafer is bonded to a carrier substrate (like SiO₂/Si or glass), followed by thermal annealing to initiate thin-film splitting. The result is a high-quality nanometer-thick LiNbO₃ film with superior flatness, uniformity, and optical performance.

Compared to mechanical exfoliation, ion slicing enables:

Sub-500nm thickness control, which supports ultra-compact, high-speed modulators (>60GHz);

Compatibility with large-diameter substrates (6-8 inches) for volume manufacturing;

Lower surface roughness and defect density, beneficial for low-loss waveguides, resonators, and nonlinear devices.

In China, companies like Jinan Jingzheng, research institutes like IOPTTE are progressing in mastering ion energy control, bonding interface conditioning, and post-process polishing—building a domestic capability in high-performance LNTF.

As photonic devices move toward higher integration and faster data rates (800G/1.6T+), LNTF made by ion slicing is expected to dominate due to its superior performance and scalability. In the near future, a full-stack LNTF supply chain—ranging from crystal growth to ion implantation and wafer bonding—will likely emerge in Asia.
