Ionization breast imaging device is a medical device that uses ionizing radiation to obtain breast image information. Common ionization breast imaging device is mainly breast X-ray equipment. It can clearly show the tiny structure of the breast, which is of great significance for the diagnosis of early breast cancer, especially for detecting tiny calcifications in breast tissue. It has high sensitivity, which may be early signs of breast cancer. The examination process is relatively simple, and the patient's cooperation is not required. The whole examination process can usually be completed in a short time. It is suitable for breast examinations of most women, whether young or old, and can be used for preliminary breast disease screening through mammography.
