Abstracts

The global IoT-based Air Pollution Monitoring System market size is predicted to grow from US$ 199 million in 2025 to US$ 276 million in 2032; it is expected to grow at a CAGR of 4.9% from 2026 to 2032.

The IoT-based Air Pollution Monitoring System is an intelligent platform that leverages sensor networks, wireless communications, and cloud computing technologies to provide real-time, accurate, and comprehensive monitoring of atmospheric environmental quality. By widely deploying a variety of high-precision gas and meteorological sensors, the system builds a dense sensing layer network to collect regional air quality data in real time. This data is aggregated to a cloud platform via wireless transmission methods such as NB-IoT, LoRa, or 4G/5G. After cleaning, storage, and big data analysis, dynamic pollution distribution maps, trend forecasts, and source tracking reports are generated. Users can view the air quality index, pollutant concentrations, and historical changes in real time via the web or mobile app. The system also supports setting threshold alerts, automatically notifying environmental protection departments or the public of any exceedances.

United States market for IoT-based Air Pollution Monitoring System is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
