The global IoT-based Drainage Decision Support System market size is predicted to grow from US\$ 1552 million in 2025 to US\$ 2961 million in 2032; it is expected to grow at a CAGR of 9.9% from 2026 to 2032.

An IoT-based drainage decision-making system is an intelligent system designed to monitor the operational status of drainage infrastructure, issue early warnings, and facilitate dispatch decisions. It achieves this by deploying various sensors and monitoring devices across urban drainage networks, pumping stations, rain gauges, and critical nodes to collect real-time data such as water levels, flow rates, and rainfall amounts and subsequently transmitting this data to a central platform for analysis and processing via IoT communication technologies. Typically, the system integrates data analysis models or algorithms to dynamically assess the risks of urban flooding, the load on the drainage network, and drainage efficiency, thereby providing dispatch personnel with scientific support for decision-making. It is widely applied in the fields of urban flood control, drainage management, and smart water management.
