An IP transceiver is a radio transmitter system that uses the communication lines of a major telecommunications carrier.

IP stands for "Internet Protocol" and refers to the rules and procedures for setting the source and destination of data. On the Internet, data is exchanged from PC to PC according to IP rules.

The distinguishing feature of an IP transceiver is that it sends radio waves over telephone lines, allowing for a wider calling area compared to conventional radios. It is possible to communicate even in places where there are many obstacles such as underground or in tunnels. It is a hybrid means of communication that combines the advantages of both cell phones and radios.

The global IP Transceiver market size is projected to grow from US$ million in 2024 to US$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
