I/Q demodulators are electronic devices that decompose an input signal into two orthogonal components, known as the in-phase (I) and quadrature (Q) components. This decomposition provides several advantages in signal processing. Firstly, it significantly reduces signal distortion by minimizing interference between the I and Q components. Secondly, I/Q demodulators enhance signal resolution, allowing for more precise signal processing. Additionally, they possess a wide bandwidth capability, enabling operation across various frequency ranges, making them highly versatile in different signal processing applications. In summary, I/Q demodulators play a crucial role in signal processing, enhancing efficiency and precision.

United States market for I/Q Demodulators is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
