## Abstracts

The global IR Curing Ovens market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Infrared (IR) energy is a heat source commonly used to apply industrial coatings, like powder coating, paint and more. Infrared creates this energy with electromagnetic waves that can cure many products in mere minutes. In fact, IR emitters provide temperatures ranging from 500 to 4,200 degrees Fahrenheit. During this process, a portion of the energy bounces off the surface, the coating absorbs some of the energy and the rest of the energy heats up the substrate.

IR Curing Ovens are machines that use infrared radiation to heat and cure coatings on various substrates, such as metal, wood, plastic, or glass. IR Curing Ovens can transfer heat directly to the coating surface without heating the surrounding air or the entire substrate, which makes them more efficient and faster than conventional convection ovens?. IR Curing Ovens can also be combined with convection ovens to create a hybrid system that offers more flexibility and control over the curing process. IR Curing Ovens can have different types of infrared emitters, such as shortwave, medium wave, or long wave, depending on the wavelength of the radiation and the temperature of the emitter. The industry trend of IR Curing Ovens is expected to grow in the coming years, as the demand for high-quality and environmentally friendly coatings increases globally.
