The global IR Transmitting Glass market size is predicted to grow from US$ 333 million in 2025 to US$ 568 million in 2032; it is expected to grow at a CAGR of 8.5% from 2026 to 2032.

IR Transmitting Glass is a special type of glass material. Unlike ordinary glass, it allows infrared light (thermal radiation) to pass through rather than block it. It is mainly used to manufacture lenses and windows in infrared thermal imagers, night vision devices, and other equipment. Common types include chalcogenide glasses, which are mainly composed of elements such as sulfur, selenium, and tellurium, as well as crystalline materials such as germanium, silicon, and gallium arsenide. It has high transmittance in atmospheric windows of 1-3?m, 3-5?m, and 8-12?m, making it a core material for modern infrared optical technology.

The gross profit margin of this industry is around 30%.

Increasing Adoption of Infrared Technology: As industries and applications continue to integrate infrared technology for various purposes such as surveillance, night vision, and thermal imaging, the demand for IR transmitting glass filters rises. Growing Demand in Automotive Sector: Infrared transmitting glass filters find applications in the automotive industry, particularly in advanced driver-assistance systems (ADAS). The increasing adoption of ADAS features, which often use infrared sensors, contributes to the market growth.
