## Abstracts

The global Iron Oxyhydroxide market size is predicted to grow from US\$ 1463 million in 2025 to US\$ 2259 million in 2032; it is expected to grow at a CAGR of 6.4% from 2026 to 2032.

Iron oxyhydroxide (FeO(OH)) is a class of iron-based compounds (including polymorphs such as goethite, lepidocrocite, and akaganeite) characterized by hydroxyl groups bound to iron oxide structures, widely used as pigments, adsorbents, battery materials, and precursors for iron oxides; its supply chain begins upstream with iron-bearing raw materials (iron ore, scrap iron, or ferric salts such as ferric chloride/sulfate), followed by chemical synthesis routes (precipitation, hydrothermal processing, or oxidation of ferrous solutions) carried out by specialty chemical and materials manufacturers, then midstream purification, particle size control, and surface modification for application-specific performance, and finally downstream integration into industries such as construction (anti-corrosion pigments), water treatment (arsenic/phosphate adsorption), energy storage (battery electrodes), and environmental remediation, with distribution handled by both direct manufacturers and chemical distributors supplying industrial, environmental, and advanced materials markets. In 2025, global Iron Oxyhydroxide output was about 3 million tons with 4 million tons of capacity, average prices of USD 400-700 per ton, and gross margins around 26%.
