Phosphate conversion or phosphating is a chemical and electrochemical process that forms a layer of crystalline phosphate during the surface treatment stage of steel. Phosphate conversion coatings are typically formed from zinc, iron or magnesium phosphates dissolved in phosphoric acid. When coatings are applied or immersed into steel, chemical reactions consume hydronium ions, raise the pH, and cause dissolved salts to come out of solution and precipitate on the surface. The chemical process creates a porous absorbent layer that is often considered a primer or conversion coat for subsequent oils, paints, and other protective coatings and sealants. Phosphate conversion coatings are often used as a pre-treatment to supplement anti-corrosion methods rather than on their own.

The global Iron Phosphate Conversion Coating market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
