The global Irradiation Sterilization System market size is predicted to grow from US\$ 1156 million in 2025 to US\$ 1948 million in 2032; it is expected to grow at a CAGR of 7.9% from 2026 to 2032.

In 2024, global sales of irradiation sterilization systems reached 253 units, with an average selling price of US\$4.37 million per unit. Irradiation sterilization systems utilize high-energy radiation (such as electron beams, gamma rays, or X-rays) to irradiate products, destroying or inactivating microbial DNA and RNA, thereby achieving sterilization and disinfection. This technology is widely used in medical devices, pharmaceutical packaging, food, cosmetics raw materials, and disposable consumables, offering high efficiency, reliability, and a chemical-free finish.

The irradiation sterilization system market is experiencing a period of growing demand and challenges, but this presents both opportunities and challenges. On the one hand, the continuously increasing demand for medical devices, pharmaceutical packaging, and food safety, coupled with the recognition of irradiation sterilization technology by international regulations and standards, has gradually made it a valuable alternative to traditional methods such as ethylene oxide and high-temperature sterilization. Simultaneously, the rapid expansion of emerging markets such as Asia-Pacific is further fueling the industry's growth potential. On the other hand, the high investment required for the system equipment, stringent construction and operation requirements, and the high compliance costs resulting from differing regulations across countries, coupled with consumers' lack of awareness of irradiated food and the emergence of emerging alternative sterilization technologies, have all hindered market adoption.
