Irrigated-Tip Ablation Catheters are medical devices used for cardiac ablation treatments. During a cardiac ablation procedure, doctors use an ablation catheter guided through blood vessels into the patient's heart in order to locate and ablate abnormal heart tissue. This particular type of ablation catheter has an infusion tip that allows cooling fluid to be infused through the tip of the catheter. This design can effectively reduce tip temperature and reduce the risk of tissue damage and thrombosis. Additionally, through perfusion, ablation efficiency and depth can be increased, allowing for better control of the treatment area.
