The global Irrigation and Suction Fluid Management System market size is projected to grow from US\$ million in 2022 to US\$ million in 2029; it is expected to grow at a CAGR of % from 2023 to 2029.

The major consumer markets for Irrigation and Suction Fluid Management System are North America and Asia. With the gradual recovery of the global economy after the COVID-19 outbreak and the return of major economies to normal, the medical industry will see certain growth. More and more hospitals and clinics are able to perform endoscopic surgery. As a result, the demand for Irrigation and Suction Fluid Management System will increase over a predictable period of time.

An Irrigation and Suction Fluid Management System is a medical device used during surgical procedures to remove excess fluids and debris from the surgical site, as well as to deliver irrigation fluids to the area. This system typically consists of a suction pump, an irrigation pump, tubing, and specialized instruments. During surgery, the system is used to control fluid levels in the operative field, which helps to maintain optimal visualization for the surgeon. The suction function removes unwanted fluids and debris, while the irrigation function delivers sterile fluids to help clean the area and maintain tissue hydration. The system is also designed to prevent cross-contamination between the irrigation and suction functions, ensuring that sterile fluids are not contaminated with surgical debris or bacteria. In addition, the system can be programmed to control fluid flow rates and pressure levels, allowing for precise control over the surgical environment.
