The global Ischemic Stroke Aspiration System market size is predicted to grow from US\$ 1227 million in 2025 to US\$ 1516 million in 2032; it is expected to grow at a CAGR of 3.1% from 2026 to 2032.

An Ischemic Stroke Aspiration System is a neurointerventional device system used for endovascular revascularization in patients with acute ischemic stroke caused by large-vessel occlusion. It advances a distal access catheter or aspiration catheter into the occluded intracranial vessel and uses negative pressure to capture, secure, and remove thrombus, thereby restoring cerebral perfusion. The system typically consists of a large-lumen flexible aspiration catheter, vacuum pump or syringe-based aspiration device, tubing, hemostasis valve, collection canister, guide catheter, microwire, and related access devices. It can be used as direct aspiration first-pass thrombectomy or in combination with a stent retriever. Its core value lies in shortening reperfusion time, reducing device exchanges, improving first-pass recanalization potential, and helping stroke centers build rapid, standardized, and reproducible emergency thrombectomy workflows. The average gross profit margin of this product is 45%.

Ischemic stroke aspiration systems are one of the most clinically valuable and growth-oriented segments in neurointerventional devices. Their opportunities are driven by stroke center development, improved emergency green channels, expanding indications for mechanical thrombectomy, better imaging-based patient selection, and high-end substitution by domestic neurointerventional devices. Acute ischemic stroke treatment is highly time-sensitive, and aspiration thrombectomy is becoming an important revascularization route for large-vessel occlusion because of its relatively direct workflow, fewer device exchanges, high recanalization efficiency, and compatibility with stent-retriever techniques. As stroke centers move from capacity building to quality

improvement, clinical demand is shifting from ?being able to perform thrombectomy? to ?faster reperfusion, higher first-pass success, fewer complications, and more stable workflows.? For companies, aspiration systems are not merely catheter products, but high-value entry points connecting access catheters, thrombectomy devices, imaging navigation, emergency workflows, and stroke center solutions. This industry has high barriers, with core challenges in product performance, clinical evidence, physician learning curves, regulatory access, and hospital payment capacity. Intracranial vessels are tortuous and small, while clot composition varies widely, placing extremely high requirements on catheter flexibility, pushability, kink resistance, distal access, inner-lumen area, and negative-pressure transmission. Insufficient catheter support or unstable aspiration efficiency may affect recanalization outcomes, while improper distal manipulation may increase the risk of vascular injury and distal embolization. Imported brands still retain strong recognition among premium hospitals and expert operators, requiring domestic companies to build trust through multicenter clinical data, real-world evidence, stable supply, and procedural training. Future competition will not be limited to price, but will depend on portfolio completeness, reperfusion efficiency, access compatibility, clinical education, and stroke center service capability. Downstream demand is moving from single-device procurement toward integrated stroke emergency and neurointerventional solutions. Large tertiary hospitals and advanced stroke centers focus on first-pass recanalization, complex clot handling, distal access performance, combination strategies with stent retrievers, and safety in difficult cases. Municipal hospitals and county-level stroke centers place greater emphasis on ease of use, standardized training, emergency response efficiency, and consumable accessibility. As stroke networks extend to lower-tier hospitals and imaging-based screening and remote consultation become more common, more patients will be brought into mechanical thrombectomy pathways, and aspiration system demand will expand from leading centers to regional centers. Physicians' preference for products with large lumen, high flexibility, strong aspiration force, low vessel trauma, and simplified workflow will become clearer, driving the market from single consumables toward combination-based, platform-based, and procedure-based solutions.
