The global Isosorbide-based Polymers market size is predicted to grow from US\$ 1647 million in 2025 to US\$ 3432 million in 2032; it is expected to grow at a CAGR of 11.3% from 2026 to 2032.

Isosorbide-based polymers are polymer materials formed by polymerization of isosorbide and other monomers. Isosorbide is a bicyclic diol derived from renewable resources and is obtained by chemical conversion of glucose. Isosorbide-based polymers have excellent heat resistance, mechanical properties and biodegradability, and are widely used in bio-based plastics, coatings, adhesives and packaging materials. Because of its renewable and environmentally friendly source, it has attracted much attention in the field of green chemistry and sustainable materials.

The global isosorbide-based polymer market is experiencing accelerated growth, driven by rapidly growing demand for sustainable materials and the global trend toward plastic substitution. Isosorbide-based polymers, a green polymer material made from the bio-based monomer isosorbide, exhibit excellent thermal stability, mechanical properties, and biodegradability. They are widely used in packaging, coatings, adhesives, biomedical materials, and other applications. Government policy support for renewable materials and a low-carbon economy, as well as rising consumer environmental awareness, are key drivers of market expansion.

However, the market still faces challenges, primarily due to high raw material costs, immature production technology, and limited competitiveness with traditional petrochemical-based polymers. The current biomass resource supply chain still needs to be optimized, and the scale and automation of related processes need to be improved. This, to a certain extent, limits the production capacity release and price

reduction of isosorbide-based polymers.

Looking ahead, as green isosorbide production processes continue to advance and the technology matures, it is expected to significantly reduce costs and increase market penetration. Global demand for biodegradable plastics and functional bio-based materials will continue to grow, providing ample room for development for isosorbide-based polymers. Developed regions such as North America and Europe will continue to lead the way in technological and regulatory advancements, while emerging markets such as Asia-Pacific will become new growth drivers, unlocking end-use demand and building localized production capacity. Overall, the isosorbide-based polymer market is steadily progressing towards environmentally friendly, high-performance materials, demonstrating its potential for sustainable development.
