## Abstracts

The global Isostatic Graphite and Extruded Graphite market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Isostatic graphites and extruded graphites are different types of high-purity graphite materials. The isostatic graphite is prepared by placing graphite powder in a rubber bag or rubber mold and then applying pressure evenly in a high-pressure environment. The extruded graphite is made by extruding graphite powder through an extruder under high temperature and high pressure. The process is relatively simple and the cost is relatively low.

The isostatic graphite has the characteristics of high density, excellent thermal conductivity, and good corrosion resistance, and the extruded graphite has low density, good processability, high wear resistance and pressure resistance. The specific choice of graphite material depends on the specific needs and application scenarios.
