iTOF camera, full name is indirect Time-of-Flight camera, is a technical device that uses the principle of time-of-flight (ToF) of light for three-dimensional imaging. Specifically, the iTOF camera transmits a modulated infrared light signal into the scene, and then the sensor receives the light signal reflected back by the object to be measured in the scene, and calculates the phase difference between the transmitted signal and the received signal based on the accumulated charge during the exposure (integration) time, thereby indirectly obtaining the depth information of the target object.

The global ITOF Camera market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
