A gemstone grade diamond made manually. It is a gemstone grade diamond that uses graphite or diamond powder, or a mixture of graphite and diamond powder, as the carbon source, and dissolves them in an iron-nickel alloy catalyst. By utilizing the temperature gradient of the high-temperature and ultra-high pressure reaction chamber, the dissolved carbon in the catalyst enters the high-pressure chamber, and precipitates on the lower temperature diamond seed crystals to grow. There are colorless, yellow, green, and blue varieties synthesized, most of which are yellow. The crystal can form a polyhedron consisting of Octahedron, cube, Rhombic dodecahedron and tetragonal

trioctahedron. Special spiral growth lines or dendritic lines can be seen on the crystal surface, parallel crystal edges or the above simplex growth lines or growth cones can be seen inside, and even corresponding color bands or color zones can be displayed, as well as small inclusions of Fe Ni alloy catalyst that grow directionally or unevenly along the layer. These yellow and green Synthetic diamond may emit obvious yellow fluorescence under shortwave ultraviolet light, and yellow varieties are more likely to have phosphorescence. The largest known single crystal weighs 11.14 carats, which is a yellowish Octahedron skew crystal.
