A joint boot is a protective rubber device used in automotive joints like constant velocity joints and ball joints. They seal in lubricating grease and prevent foreign substances like dust and water from entering. There are two main types of joint boots: one for parts involving centrifugal force, expansion, and contraction, and another for tilting movements.

Joint boots operate under challenging conditions, enduring constant bending, turning, and exposure to harsh elements. Made of rubber, they are prone to breakage and deterioration over time. This is especially critical for drive shaft boots, which rotate at high speeds. A broken or cracked boot can lead to grease leakage, causing noise, vibration, and potential safety hazards.
