Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

The spacer molds are intended for use in patients undergoing two-stage revision knee surgery for an infected total joint. In the case of infected revision interventions, all implant components are usually removed during the two-stage surgery, and the resulting joint spaces are filled with intraoperatively prepared pads or spacers made of bone cement. The spacers, which are loaded with antibiotics, are usually formed by hand and are generally not allowed to passively mobilize in the patient since the surfaces of the articulating spacers are incongruent and not smooth enough. After successful healing of the infections, these spacers are removed in a second surgery and replaced with new implant components.

The global Joint Cement Spacer Mold market size is projected to grow from US\$ 696.5 million in 2023 to US\$ 1107.3 million in 2030; it is expected to grow at a CAGR of 6.8% from 2024 to 2030.
