Journal bearings are mechanical components used to support rotating shafts within machinery or equipment by providing a low-friction surface for smooth and continuous motion. Unlike rolling bearings, which use rolling elements such as balls or rollers, journal bearings utilize a thin layer of lubricant, typically oil or grease, to create a fluid film between the shaft and the bearing surface. This fluid film lubrication reduces friction and wear, allowing the shaft to rotate freely with minimal resistance. Journal bearings consist of two main components: the stationary bearing shell (also known as the bushing) and the rotating shaft. The shaft is typically cylindrical in shape, and it fits snugly within the bearing shell, which is usually made of bronze, brass, or other bearing materials. The lubricant is fed into the bearing clearance through lubrication channels or grooves, ensuring adequate lubrication and preventing metal-to-metal contact between the shaft and the bearing surface. Journal bearings are commonly used in various applications, including engines, turbines, pumps, compressors, and industrial machinery, where smooth and reliable shaft rotation is essential for optimal performance and longevity.

The global Journal Bearing market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
