Kairomones are chemical substances released by one organism that unintentionally benefit another organism, usually in predator-prey or parasite-host interactions. For instance, mosquitoes are attracted to humans by kairomones like carbon dioxide, which help them locate a blood meal. In nature, kairomones play a key role in ecological balance, aiding predators or parasites in finding their hosts. They are used in pest control strategies by mimicking these chemicals to trap or manage pest species, offering a sustainable and targeted method for reducing harmful populations in agriculture.

The global kairomones market size was valued at USD 633.65 million in 2022 and is projected to grow from USD 713.88 million in 2023 to USD 1,785.06 million by 2030, exhibiting a CAGR of 13.99% during the forecast period. North America dominated the kairomones market with a market share of 30.37% in 2022.
