The Kerr microcavity optical frequency comb is a frequency comb generator based on the Kerr effect and optical microcavity technology. It uses the strong entanglement effect of the optical microcavity on the light beam, combined with the Kerr effect (that is, the refractive index of the medium changes with the light intensity) to achieve the formation of the frequency comb. Specifically, when the light beam is coupled into the optical microcavity and reflected multiple times in the microcavity, due to the existence of the Kerr effect, the propagation of light in the microcavity will cause a nonlinear change in the refractive index of the medium, which in turn causes the frequency expansion of the standing wave mode, and finally forms a comb frequency spectrum.

The global Kerr Microcavity Frequency Comb market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
