The global Keyseating Machine market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

A keyseating machine is a type of machine tool used to cut keyways, which are slots or grooves in a shaft or hub that allow for the insertion of a key or spline. Keyways are commonly used in mechanical systems to transmit torque and prevent relative rotation between two components.

The keyseating machine typically consists of a cutting tool called a broach, which has multiple teeth or cutting edges. The broach is mounted on a reciprocating ram or slide, which moves back and forth along the length of the workpiece. As the broach moves, it cuts the keyway by removing material in a series of incremental cuts.

Keyseating machines can be manual or automated, with some machines capable of cutting multiple keyways simultaneously. The machines can be used to cut keyways in a variety of materials, including steel, cast iron, and non-ferrous metals.

Keyseating machines are commonly used in industries such as automotive, aerospace, and manufacturing, where precise and accurate keyways are required for the proper functioning of mechanical systems.

United States market for Keyseating Machine is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
