Kidney cancer, also known as renal cancer, is a type of cancer that starts in the cells in the kidney. The two most common types of kidney cancer are renal cell carcinoma (RCC) and transitional cell carcinoma (TCC) of the renal pelvis. These names reflect the type of cell from which the cancer developed. The different types of kidney cancer (such as RCC and TCC) develop in different ways, meaning that the diseases have different long term outcomes, and need to be staged and treated in different ways. RCC is responsible for approximately 80% of primary renal cancers, and TCC accounts the majority of the remainder.

Biological therapies are drugs which are used to kill cancer cells or stop them from growing. Biological therapies are used to try to shrink or control advanced kidney cancer and help people to live longer. You may be given biological therapies for kidney cancer that has already spread, or is at high-risk of coming back after surgery.
