During the steel manufacturing process, iron ore is melted to produce pig iron. Since pig iron contains many impurities, steel is produced through a series of processes, including pig iron making, refining, and steel-making. In the refining stage, oxygen is removed from the molten steel (deoxidization), particularly towards the end of the process. This deoxidization prevents the generation of gases during cooling and solidification, resulting in higher-quality steel.

Based on the level of deoxidation, three types of raw materials (ingots) are produced. The most deoxidized form is known as killed steel, whereas other types include semi-killed and rimmed steel. Killed steel typically contains about 50 to 100 parts per million (PPM) of oxygen, compared to 100 to 200 PPM in other steel types.

The global Killed Steel market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
