The global Kinase Inhibitor in Autoimmune Diseases market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Kinase inhibitors are a class of drugs that have been explored for their potential use in the treatment of autoimmune diseases. Autoimmune diseases are characterized by an overactive immune system that mistakenly attacks the body's own tissues, leading to chronic inflammation and tissue damage. Kinase inhibitors work by targeting specific enzymes known as kinases that play a role in immune system regulation and inflammation.

According to the Global Use of Medicines 2023 released by IQVIA Institute, the global drug expenditure in 2022 was about US\$1.48 trillion (excluding COVID vaccine and treatment-related expenses), and it is predicted to grow at a rate of 3%-6% in the next few years. In terms of drug expenditure, this number in China was about 166 billion dollars in 2022. It is expected that the expenditure on medicines will increase in the next few years. From the perspective of demand, the trend of population aging, the increase of residents' wealth and the improvement of health awareness will drive the demand for medicines.
