The global KOH Developer market size is predicted to grow from US\$ 104 million in 2025 to US\$ 119 million in 2032; it is expected to grow at a CAGR of 1.9% from 2026 to 2032.

KOH developer is an aqueous alkaline chemical reagent with potassium hydroxide (KOH, commonly known as caustic potassium) as its main component. It is used in photolithography processes in micro/nano fabrication, semiconductor manufacturing, and PCB/FPC production to selectively dissolve unexposed (negative) or exposed (positive) areas of photoresist, thus achieving the patterning transfer of the photoresist.

Key characteristics of KOH developer include strong alkalinity (pH \geq 10), water solubility, selective dissolution of photoresist, presence of metal ions (K $^+$), and the need for nitrogen protection to extend shelf life.

The upstream main raw material for KOH developer is electronic-grade KOH, with auxiliary raw materials including buffers (phosphates/carbonates), surfactants, and electronic-grade ultrapure water. The midstream core production processes include ingredient preparation, closed mixing, purification and filtration, pH calibration, and filling and storage. Downstream applications primarily involve negative photoresists and include PCB/FPC, display panels, sensors, and semiconductors.

In 2025, global KOH developer sales reached 12,000 tons, with a production capacity of 15,500 tons, an average selling price of US\$8,900 per ton, and an average gross profit margin of 28%-35%.

United States market for KOH Developer is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for KOH Developer is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

Europe market for KOH Developer is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
