Laboratory-grown (LGD) is diamond that is produced in a controlled technological process (in contrast to naturally formed diamond, which is created through geological processes and obtained by mining). Unlike diamond simulants (imitations of diamond made of superficially similar non-diamond materials), synthetic diamonds are composed of the same material as naturally formed diamonds—pure carbon crystallized in an isotropic 3D form—and share identical chemical and physical properties. Lab grown diamonds are made in laboratories and factories. These diamonds are identical to natural diamonds in their composition and appearance. Lab grown diamonds are manufactured using techniques such as HPHT, which stands for high pressure and high temperature and CVD, which stands for chemical vapor deposition. Diamonds made in labs are generally of better quality than natural diamonds as they are made in controlled environments with constant monitoring and quality control.

The global Lab Grown Diamonds market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
