The global Laboratory Air Classifier market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The laboratory airflow classifier is a device specially used to subdivide, classify and separate solid particles in a laboratory environment. It uses the mechanical principle of air flow to classify the particles in the mixture according to their size, shape, density and other characteristics.

The workflow of laboratory airflow classifiers: feeding, classification, separation, circulation, has the characteristics of precise classification ability, flexible adjustment performance, no pollution and no damage, small size and portability, and wide application. It can be used to separate, classify and evaluate the particle size distribution, particle shape and other characteristics of solid particles, providing important data support for the laboratory research.
