## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

A lab recirculating chiller can achieve temperature ranges of  $-25\text{ }^{\circ}\text{C}$  to  $130\text{ }^{\circ}\text{C}$  (thus, some can double as heaters as well). Digital PID temperature controllers ensure that the recirculating cooler/recirculating chiller reaches the desired temperature precisely and quickly. The customer should seek recirculating chillers with a front filling port and no side vents, making them safe to place near other laboratory equipment, without the risk of water damage.

A laboratory circulator will typically feature a liquid reservoir, a heating and/or cooling system, and a temperature control mechanism. Some lab circulators are designed to work in conjunction with a separate liquid bath or water jacket, while others combine both a circulator and an open bath basin/water jacket in one. Temperature ranges can be as wide as  $-95\text{ }^{\circ}\text{C}$  to  $200\text{ }^{\circ}\text{C}$ , with pump flows of up to 26 L per minute. As a general rule, high-end lab circulators have a wider temperature range than economy models. Most laboratory circulators utilize digital temperature control, but a few employ analog technology for cost savings and customization.
