By passing the material through a grinding chamber with a rotor, the grinding chamber is filled with a certain amount of grinding media (grinding beads), and the material collides, squeezes, stirs and mixes with the internal grinding media through the rotating rotor to achieve slurry crushing, a kind of grinding equipment with refining effect. Compared with sand mills for industrial production, it has the characteristics of small size, compact structure, low power, light movement, convenient disassembly and assembly, relatively small output, low noise, and low price. The biggest difference from the sand mill used in industrial production is the volume of the grinding chamber. The volume of the grinding chamber of the laboratory sand mill ranges from as small as 0.1L to as large as 10L and 15L.
