A Laboratory Visible (VIS) spectrophotometer is a scientific instrument used to measure the absorption, transmission, and reflection of light within the visible spectrum (typically 380 to 780 nanometers) by a sample. It operates on the principle of spectrophotometry, where the sample is illuminated with a broad spectrum of light, and the intensity of light transmitted through or reflected by the sample is measured at different wavelengths. VIS spectrophotometers consist of a light source, a monochromator or filter system to select specific wavelengths of light, a sample holder, and a detector that measures the intensity of light passing through the sample. By analyzing the absorption or transmission of light by the sample at different wavelengths, VIS spectrophotometers can provide valuable information about the chemical composition, concentration, and optical properties of substances in solution or as solid samples. These instruments find widespread applications in analytical chemistry, biochemistry, pharmaceuticals, environmental science, materials science, and other fields where quantitative analysis of colored or colorless substances is required.

The global Laboratory VIS Spectrophotometer market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
