Lamella settlement tanks are high-efficiency solid-liquid separation devices that utilize multiple inclined plates to increase settling area and accelerate particle sedimentation. Operating on gravity settling and shallow-depth theory, these tanks enable suspended solids to separate rapidly between plate gaps while clarified water overflows from the top. Known for their compact footprint, high processing capacity, and stable performance, lamella tanks are used in wastewater treatment, mining tailings dewatering, and industrial effluent management. Constructed from corrosion-resistant materials like stainless steel or polypropylene, they withstand high loads and harsh environments. By optimizing the efficiency of traditional settling tanks, lamella systems serve as core components in modern water treatment infrastructure.
