Recirculating Aquaculture Systems (RAS) allow fish to be farmed in net cages or tanks instead of open-air ponds. These systems allow high-density fish production within a breeding environment that is controllable by the operator of the facility. The filters of the recirculating system clean and recycle the water, sending it back to the tanks. New water is only added to the tanks to compensate for water lost due to splashing and evaporation, and to replace that used to remove waste materials. Recirculating systems can be used to produce both fresh- and saltwater species, including rainbow trout, salmon, catfish, whiteleg shrimp, eel, turbot etc.

The global Land-based RAS Aquaculture market size is projected to grow from US\$ 5604 million in 2024 to US\$ 9130 million in 2030; it is expected to grow at a CAGR of 8.5% from 2024 to 2030.
